Reuse or recycle your e-waste

Ian Williams, Professor of Applied Environmental Science, has shared tips on what we can all do with our e-waste, such as old phones, devices, cables and chargers, as well as batteries, and electronic items such as kettles, toasters, lamps and televisions.

E-waste is the fastest growing solid waste stream in the world, with levels predicted to exceed 75 million tonnes by 2030. In the UK, we generate 1.5 million tonnes of e-waste every year.

Professor Williams said: “This colossal amount of electronics waste is largely due to how quickly we upgrade and replace items such as mobile phones and laptops. Many people don’t know how to dispose of these items responsibly. It’s vital we educate people on what to do with their e-waste to dispose of it safely and responsibly, before the situation becomes much worse.”

Reuse should be the priority for electronics waste. “Mobile phones and their associated cables are a prime example of items that are constantly being improved so we replace them quickly, but the old ones are still functional,” said Professor Williams.

If reuse isn’t an option, electronic waste should be disposed of responsibly, and not in the dustbin. “Chargers and cables consist of plastics, metals and other materials that don’t decompose naturally. All cables contain copper, a valuable material, making them suitable for recycling. Many standard plastics can be recycled too.”

MISE EN SITUATION

You are an IT technician working for a small company. Your manager wants the company to be more eco-friendly. Give him information about how to implement ecological practices in the company.

QUESTIONNEMENT

What is green computing?
How can you reduce the digital carbon footprint of the company?
What are the advantages for the company?
